

Milpa Garden

A GREEN COVER SEED BLEND

Milpa is best seeded using a no-till drill or other seeding device and placing seed at a depth of 3/4" - 1". It can also be broadcast into areas with minimal plant competition such as a new plot or one where a seedbed has recently been prepared. Light incorporation or dragging can help with seed to soil contact but don't cover the seed with more than 3/4" of soil.

SEEDING RATE

Plant 35 pounds per acre when seeding with a no-till drill or other planting implement and 50 pounds per acre when broadcasting.

TIMING

Wait to plant until after the last frost and soil temperatures are above 60 degrees and rising. Planting of these mixes should be completed by mid-summer.
